

HOW TO CHOOSE A SAFER PESTICIDE TO MANAGE PESTS

Traps, baits and gels provide better long-term control of pests because:

- ▶ pests take the pesticide back to the nest or hiding places where it kills the whole colony;
- ▶ the pesticide is contained and does not expose staff and children;
- ▶ they last longer than sprays.

Foggers and sprays are less effective because they:

- ▶ do not last very long;
- ▶ kill pests you can see, but do not kill the nest or pests hiding and breeding in out-of-the-way places;
- ▶ can spread pesticides throughout your facility and expose children and staff.
